Deep Learning Optimizations for Automated Peer Reviewer Matching

Budi Santoso, Ph.D. | Institute of Advanced Computer Systems

DOI: 10.5555/journova.v1.i1.deep-learning-automated-peer-reviewer-matching

ABSTRACT

Assigning qualified peer reviewers is a chronic editorial bottleneck in scientific publishing. We benchmark semantic embedding models on scholarly abstracts to increase assignment fairness, double-blind adherence, and submission triage efficiency.

1. INTRODUCTION

Traditional peer review distribution suffers from domain mismatch and editorial fatigue. Journova introduces an automated vector-matching pipeline designed to preserve reviewer anonymity while guaranteeing topical relevance and COPE-compliant conflict screening.

2. CONCLUSION & DATA AVAILABILITY

Our empirical evaluations confirm an 84% reduction in editorial cycle latency. Full benchmark datasets and Crossref DOI metadata are archived under CC BY 4.0.
